TestCase #7

"Numeric filter (minimum values - 1)"

The problem found is related to the filter feature. In this feature, minimum values are required for the filter to work properly but it was possible to insert values below the minimum required.

CONTRAST CHECKER

The WAVE tool was used to evaluate the contrast on the homepage, result's page and house description page. In general, the contrast between background and elements are adequate, however there could be some improvement regarding the texts and buttons that use gray values (<https://imgur.com/dAGzCwk>). The contrast checker's result show low contrast between gray values and background.

The low contrast may cause a user experience problem. For example, to some users the buy button (see [link above](#)) may be interpreted as an option that is not available because of the color used. To users that are in a hurry or multitasking, the button may not even be identified and therefore the user would not find a way to interact with the website using that option.
